EDUCATION

University of British Columbia

Bachelor of Applied Science in Computer Engineering

Vancouver, BC

Expected May 2029

EXPERIENCE

Electronics Engineering Intern

Fulcrum Air

May 2026 – August 2026

Calgary, AB

- Owned the complete design lifecycle of a 4-channel motor controller PCB to drive 12V actuators at 3A
- Designed system architecture around Teensy 4.1 to meet core performance requirements, supporting 150 W continuous power draw, CAN communication, analog current sensing, and Hall-effect positioning
- Performed high-density routing for an 8-layer PCB within a strict 80 mm x 54 mm package, implementing orthogonal routing, dedicated power and ground planes, ground stitching, and 2.1 MHz switching noise shielding
- Engineered a power-loss detection circuit and falling-edge ISR using a voltage divider and bulk capacitor, guaranteeing non-volatile EEPROM backup of actuator positions within 5 ms of power disconnection
- Built a test bench and developed C++ firmware to validate PCB function, verifying MCU pinouts, voltage regulation, inrush current stabilization, CAN signal integrity, and bidirectional actuation under dynamic loads

Electrical Engineer

UBC Rover

September 2025 – Present

Vancouver, BC

- Designed power architecture, telemetry systems, and motor drive PCBs for an autonomous test rover
- Tested a powertrain prototype around the L298N full-bridge motor driver and Nucleo F446RE MCU
- Developed C firmware using STM32 HAL for UART communication, command parsing, and Hall effect feedback

Electrical Engineering Intern

University of Calgary

July 2023 – August 2023

Calgary, AB

- Modelled and simulated circuits in LTspice to support research on novel Op-Amp-based oscillator topologies
- Validated circuit performance, achieving 95% correlation between simulation and lab measurements
- Utilized oscilloscopes, signal generators, and DMMs to debug test circuits and verify frequency responses

PROJECTS

24V – 5V Buck Converter | LTspice, Altium

August 2026 – Present

- Designed an asynchronous buck converter powered by a 6S LiPo input to deliver up to 500 mA at 85% efficiency
- Implemented an N-channel high-side MOSFET with bootstrap gate drive and discrete analog Type III compensation, sizing propagation delays and slew rates to prevent shoot-through and minimize switching losses
- Simulating closed-loop compensation in LTspice, validating small-signal Bode stability and dynamic load response
- Performing 4-layer PCB layout in Altium Designer, tightly constricting high- di/dt switching loops, optimizing Schottky diode return paths, and routing unbroken ground reference planes to minimize EMI and radiated noise

Self-Balancing Robot | C++, ESP32, I2C

July 2026 – August 2026

- Developed a standalone C++ device driver for the MPU-6050 from scratch, writing directly to I2C registers to configure power states, set gyroscope and accelerometer ranges, and parse 14-byte data bursts
- Implemented 1 kHz non-blocking data acquisition and applied a complementary filter to fuse accelerometer and gyroscope readings, achieving low-latency angle estimation while reducing gyroscope angular drift by 85%
- Programmed a custom closed-loop PID controller from first principles without third-party frameworks, incorporating anti-windup clamping, derivative filtering, and deadband compensation
- Programmed deterministic PWM generation using ESP32-C3 hardware timers to drive an L298N dual-motor bridge, converting raw PID outputs into directional motor commands

TECHNICAL SKILLS

Hardware: FPGA Design, PCBA Design, CAN, SPI, I2C, UART, RS-485, STM32, ESP32

Tools: Altium, KiCad, LTspice, MATLAB, Simulink, Git

Languages: C/C++, Python, SystemVerilog, Java

Lab: Oscilloscopes, Logic Analyzers, DMM, Function Generators, Soldering, Circuit Debugging
